- 1 Introduction
- 2 UMV-SO(3)
- 3 Simulations setup and main results
- 4 Conclusion

Background

Background

Attitude is the way in which the rigid body is disposed in space.

The attitude state representation: Euler angles.

$$\phi \in [-\pi, \pi], \theta \in [-\frac{\pi}{2}, \frac{\pi}{2}], \psi \in [-\pi, \pi]$$

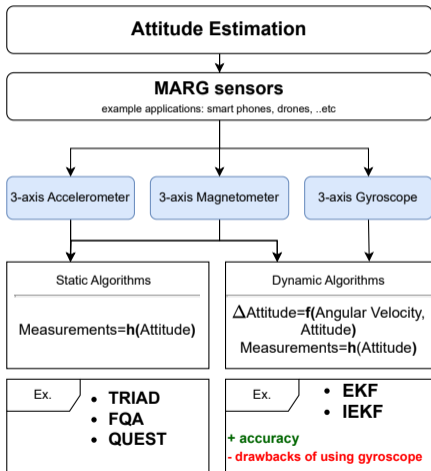

Quaternion.

$$\mathbf{q} \in \mathbb{R}^4 : \mathbf{q}^T \mathbf{q} = 1$$

Rotation matrices.

$$SO(3) = \{\mathbf{R} \in \mathbb{R}^{3 \times 3} : \mathbf{R}\mathbf{R}^T = \mathbf{I}_3, \det(\mathbf{R}) = 1\}$$

Background

Attitude is the way in which the rigid body is disposed in space.

The attitude state representation: Euler angles.

$$\phi \in [-\pi, \pi], \theta \in [-\frac{\pi}{2}, \frac{\pi}{2}], \psi \in [-\pi, \pi]$$

Quaternion.

$$\mathbf{q} \in \mathbb{R}^4 : \mathbf{q}^T \mathbf{q} = 1$$

Rotation matrices.

$$SO(3) = \{\mathbf{R} \in \mathbb{R}^{3 \times 3} : \mathbf{R}\mathbf{R}^T = \mathbf{I}_3, \det(\mathbf{R}) = 1\}$$

Why not using Gyroscope

The drawbacks of using a gyroscope:

- Relatively high-power consumption [Liu et al., 2017].
- Bias and noise [Hiller et al., 2019].
- The need to know the noise covariance matrix.

Solutions for attitude estimation without using a gyroscope:

- Static algorithms. (TRIAD, QUEST [Shuster and Oh, 1981])
- Angular motion estimation algorithms. [Ciblak, 2007]

New approach

Our solution is to consider the angular velocity as an **unknown input** and hence avoid the use of a gyroscope for attitude estimation.

Problem statement

The discrete-time state-space model:

$$\mathbf{R}_k = \mathbf{f}(\mathbf{R}_{k-1}, \boldsymbol{\omega}_{k-1}, \mathbf{w}_{k-1})$$
$$\mathbf{y}_k = \begin{pmatrix} \mathbf{a}_k^b \\ \mathbf{b}_k^b \end{pmatrix} = \begin{pmatrix} \mathbf{R}_k^{-1} \mathbf{g} \\ \mathbf{R}_k^{-1} \mathbf{m}_e \end{pmatrix} + \mathbf{v}_k^y$$

$$\boldsymbol{\omega}_k, \mathbf{a}_k^b, \mathbf{b}_k^b, \mathbf{g}, \mathbf{m}_e, \mathbf{w}_k \in \mathbb{R}^3$$

$$\mathbf{y}_k, \mathbf{v}_k^y = \begin{pmatrix} \mathbf{v}_k^g \\ \mathbf{v}_k^m \end{pmatrix} \in \mathbb{R}^3$$

$$E(\mathbf{v}_k^y \mathbf{v}_k^{yT}) = \mathcal{R}_k, E(\mathbf{w}_k \mathbf{w}_k^T) = \mathcal{Q}_k$$

$$\mathbf{f} : \text{SO}(3) \times \mathbb{R}^3 \times \mathbb{R}^3 \rightarrow \text{SO}(3)$$

Our aim is to design a dynamic algorithm to estimate the attitude without using gyroscope measurements while considering them as unknown inputs.

The second contribution

Design UMV-SO(3) algorithm for **state estimation on SO(3) with unknown input** without having direct feedthrough to the output (measurement) function.

- 1 Introduction
- 2 UMV-SO(3)**
- 3 Simulations setup and main results
- 4 Conclusion

Filter design

For linear discrete-time systems with unknown input without direct feedthrough to the output, the four-step Kalman filter was introduced in [Gillijns and De Moor, 2007]¹ for both state and unknown input estimation.

- 1 Gives a biased prediction of the state using the state dynamic model.
- 2 Estimate the unknown input using the biased predicted state and the measurements.
- 3 Gives unbiased prior estimation of the state using the unknown input estimate.
- 4 Corrects the prior state estimate using the measurements.

¹S. Gillijns and B. De Moor. Unbiased minimum-variance input and state estimation for linear discrete-time systems. *Automatica*, 43(1):111–116, 2007.

Special Orthogonal Group SO(3)

Special Orthogonal Group SO(3):

$$SO(3) = \{\mathbf{R} \in \mathbb{R}^{3 \times 3} : \mathbf{R}\mathbf{R}^T = \mathbf{I}_3, \det(\mathbf{R}) = 1\}$$

The exponential map: $\exp_m : \mathbb{R}^3 \rightarrow SO(3)$

$$\begin{aligned} \exp_m(\boldsymbol{\xi}) &= \exp((\boldsymbol{\xi})_{\times}) \\ (\boldsymbol{\xi})_{\times} &= \begin{pmatrix} \xi_1 \\ \xi_2 \\ \xi_3 \end{pmatrix}_{\times} = \begin{pmatrix} 0 & -\xi_3 & \xi_2 \\ \xi_3 & 0 & -\xi_1 \\ -\xi_2 & \xi_1 & 0 \end{pmatrix} \\ \exp_m(\boldsymbol{\xi}) &= \mathbf{I}_3 + \frac{\sin(\|\boldsymbol{\xi}\|)}{\|\boldsymbol{\xi}\|} (\boldsymbol{\xi})_{\times} + 2 \frac{\sin(\|\boldsymbol{\xi}\|/2)^2}{\|\boldsymbol{\xi}\|^2} (\boldsymbol{\xi})_{\times}^2 \end{aligned}$$

Some properties:

$$\begin{aligned} \exp_m(\boldsymbol{\xi})^{-1} &= \exp_m(-\boldsymbol{\xi}) \\ (\boldsymbol{\xi}_1)_{\times} \boldsymbol{\xi}_2 &= -(\boldsymbol{\xi}_2)_{\times} \boldsymbol{\xi}_1 \end{aligned}$$

Error representation:

$$\begin{aligned} \exp_m(\boldsymbol{\xi}) &= \hat{\mathbf{R}}^T \mathbf{R} \\ \mathbf{P} &= \mathbf{E}(\boldsymbol{\xi} \boldsymbol{\xi}^T) \end{aligned}$$

The dynamic equation:

$$\mathbf{R}_k = \mathbf{R}_{k-1} \exp_m(\boldsymbol{\omega}_{k-1} + \mathbf{w}_{k-1})$$

Prediction

The dynamic equation:

$$\mathbf{R}_k = \mathbf{R}_{k-1} \exp(\boldsymbol{\omega}_{k-1} + \mathbf{w}_{k-1})$$

The prediction:

$$\begin{aligned}\hat{\mathbf{R}}_{k|k-1} &= \hat{\mathbf{R}}_{k-1} \\ \exp(\boldsymbol{\xi}_{k|k-1}) &= \hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{R}_k \\ &\vdots \\ \boldsymbol{\xi}_{k|k-1} &= \boldsymbol{\xi}_{k-1} + \boldsymbol{\omega}_{k-1} + \mathbf{w}_{k-1} \\ E(\boldsymbol{\xi}_{k|k-1}) &= \boldsymbol{\omega}_{k-1}\end{aligned}\tag{1}$$

Prediction

The dynamic equation:

$$\mathbf{R}_k = \mathbf{R}_{k-1} \exp(\boldsymbol{\omega}_{k-1} + \mathbf{w}_{k-1})$$

The prediction:

$$\begin{aligned} \hat{\mathbf{R}}_{k|k-1} &= \hat{\mathbf{R}}_{k-1} \\ \exp(\boldsymbol{\xi}_{k|k-1}) &= \hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{R}_k \\ &\vdots \\ \boldsymbol{\xi}_{k|k-1} &= \boldsymbol{\xi}_{k-1} + \boldsymbol{\omega}_{k-1} + \mathbf{w}_{k-1} \\ E(\boldsymbol{\xi}_{k|k-1}) &= \boldsymbol{\omega}_{k-1} \end{aligned} \tag{1}$$

Angular velocity estimation

The output function:

$$\mathbf{y}_k = \begin{pmatrix} \mathbf{a}_k^b \\ \mathbf{b}_k^b \end{pmatrix} = \begin{pmatrix} \mathbf{R}_k^{-1} \mathbf{g} \\ \mathbf{R}_k^{-1} \mathbf{m}_e \end{pmatrix} + \mathbf{v}_k^y$$

$$= \mathbf{h}(\mathbf{R}_k) + \mathbf{v}_k^y$$

$$\mathbf{h}(\mathbf{R}_k) - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1}) \approx \mathbf{H}_k \boldsymbol{\xi}_{k|k-1}$$

$$\mathbf{H}_k = \begin{pmatrix} (\hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{g})_{\times} \\ (\hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{m}_e)_{\times} \end{pmatrix} \quad (2)$$

The angular velocity estimation:

$$\tilde{\mathbf{y}}_k = \mathbf{y}_k - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1})$$

$$\vdots$$

$$\tilde{\mathbf{y}}_k = \mathbf{H}_k \boldsymbol{\omega}_{k-1} + \mathbf{e}_k \quad (3)$$

where $E(\mathbf{e}_k) = 0$, $\text{Cov}(\mathbf{e}_k) = \tilde{\mathcal{R}}_k$

$$\tilde{\mathcal{R}}_k = \mathbf{H}_k \mathbf{P}_{k-1} \mathbf{H}_k^T + \mathbf{H}_k \mathcal{Q}_{k-1} \mathbf{H}_k^T + \mathcal{R}_k \quad (4)$$

$$\mathbf{M}_k = (\mathbf{H}^T \tilde{\mathcal{R}}_k^{-1} \mathbf{H})^{-1} \mathbf{H}^T \tilde{\mathcal{R}}_k^{-1} \quad (5)$$

$$\hat{\boldsymbol{\omega}}_k = \mathbf{M}_k (\mathbf{y}_k - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1})) \quad (6)$$

Angular velocity estimation

The output function:

$$\mathbf{y}_k = \begin{pmatrix} \mathbf{a}_k^b \\ \mathbf{b}_k^b \end{pmatrix} = \begin{pmatrix} \mathbf{R}_k^{-1} \mathbf{g} \\ \mathbf{R}_k^{-1} \mathbf{m}_e \end{pmatrix} + \mathbf{v}_k^y$$

$$= \mathbf{h}(\mathbf{R}_k) + \mathbf{v}_k^y$$

$$\mathbf{h}(\mathbf{R}_k) - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1}) \approx \mathbf{H}_k \boldsymbol{\xi}_{k|k-1}$$

$$\mathbf{H}_k = \begin{pmatrix} (\hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{g})_{\times} \\ (\hat{\mathbf{R}}_{k|k-1}^{-1} \mathbf{m}_e)_{\times} \end{pmatrix} \quad (2)$$

The angular velocity estimation:

$$\tilde{\mathbf{y}}_k = \mathbf{y}_k - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1})$$

$$\vdots$$

$$\tilde{\mathbf{y}}_k = \mathbf{H}_k \boldsymbol{\omega}_{k-1} + \mathbf{e}_k \quad (3)$$

where $E(\mathbf{e}_k) = 0$, $\text{Cov}(\mathbf{e}_k) = \tilde{\mathcal{R}}_k$

$$\tilde{\mathcal{R}}_k = \mathbf{H}_k \mathbf{P}_{k-1} \mathbf{H}_k^T + \mathbf{H}_k \mathcal{Q}_{k-1} \mathbf{H}_k^T + \mathcal{R}_k \quad (4)$$

$$\mathbf{M}_k = (\mathbf{H}^T \tilde{\mathcal{R}}_k^{-1} \mathbf{H})^{-1} \mathbf{H}^T \tilde{\mathcal{R}}_k^{-1} \quad (5)$$

$$\hat{\boldsymbol{\omega}}_k = \mathbf{M}_k (\mathbf{y}_k - \mathbf{h}(\hat{\mathbf{R}}_{k|k-1})) \quad (6)$$

Unbiased estimation and correction

Unbiased estimation:

$$\hat{\mathbf{R}}_k^* = \hat{\mathbf{R}}_{k|k-1} \exp_m(\hat{\omega}_{k-1}) \quad (7)$$

Correction:

$$\hat{\mathbf{R}}_k = \hat{\mathbf{R}}_k^* \exp_m(\mathbf{K}_k(\mathbf{y}_k - h(\hat{\mathbf{R}}_k^*))) \quad (8)$$

$$\exp(\boldsymbol{\xi}_k) = \hat{\mathbf{R}}_k^{-1} \mathbf{R}_k$$

$$\vdots$$

$$\boldsymbol{\xi}_k = -\mathbf{M}_k \mathbf{v}_k + \mathbf{K}_k \mathbf{H}_k^* \mathbf{M}_k \mathbf{v}_k - \mathbf{K}_k \mathbf{v}_k \quad (9)$$

$E(\boldsymbol{\xi}_k) = 0$, we need to find $\mathbf{K}_k = \arg \min \text{tr}(\mathbf{P}_k)$, where $\mathbf{P}_k = \text{Cov}(\boldsymbol{\xi}_k)$

$$\mathbf{K}_k = -\mathbf{M}_k \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T \left((\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k) \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T \right)^\dagger \quad (10)$$

$$\mathbf{P}_k = \mathbf{K}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k) \mathcal{R}_k \mathbf{M}_k^T + \mathbf{M}_k \mathcal{R}_k \mathbf{M}_k^T \quad (11)$$

where $\mathbf{h}(\mathbf{R}_k) - \mathbf{h}(\hat{\mathbf{R}}_k^*) \approx \mathbf{H}_k^* \boldsymbol{\xi}_{k|k-1}$

Unbiased estimation and correction

Unbiased estimation:

$$\hat{\mathbf{R}}_k^* = \hat{\mathbf{R}}_{k|k-1} \exp_m(\hat{\omega}_{k-1}) \quad (7)$$

Correction:

$$\hat{\mathbf{R}}_k = \hat{\mathbf{R}}_k^* \exp_m(\mathbf{K}_k(\mathbf{y}_k - h(\hat{\mathbf{R}}_k^*))) \quad (8)$$

$$\exp(\boldsymbol{\xi}_k) = \hat{\mathbf{R}}_k^{-1} \mathbf{R}_k$$

$$\vdots$$

$$\boldsymbol{\xi}_k = -\mathbf{M}_k \mathbf{v}_k + \mathbf{K}_k \mathbf{H}_k^* \mathbf{M}_k \mathbf{v}_k - \mathbf{K}_k \mathbf{v}_k \quad (9)$$

$E(\boldsymbol{\xi}_k) = 0$, we need to find $\mathbf{K}_k = \arg \min \text{tr}(\mathbf{P}_k)$, where $\mathbf{P}_k = \text{Cov}(\boldsymbol{\xi}_k)$

$$\mathbf{K}_k = -\mathbf{M}_k \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T \left((\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k) \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T \right)^\dagger \quad (10)$$

$$\mathbf{P}_k = \mathbf{K}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k) \mathcal{R}_k \mathbf{M}_k^T + \mathbf{M}_k \mathcal{R}_k \mathbf{M}_k^T \quad (11)$$

where $\mathbf{h}(\mathbf{R}_k) - \mathbf{h}(\hat{\mathbf{R}}_k^*) \approx \mathbf{H}_k^* \boldsymbol{\xi}_{k|k-1}$

UMV-SO(3)

Algorithm 1 UMV-SO(3)

Input: $\hat{\mathbf{R}}_{k-1}$, \mathbf{P}_{k-1} , \mathbf{y}_k

▷ **Biased Prediction:**

$$1: \hat{\mathbf{R}}_{k|k-1} = \hat{\mathbf{R}}_{k-1}$$

▷ **Unknown input estimation:**

$$2: \mathbf{H}_k = \left. \frac{\partial h(\hat{\mathbf{R}}_{k|k-1} \exp_m(\xi))}{\partial \xi} \right|_{\xi=0}$$

$$3: \tilde{\mathcal{R}}_k = \mathbf{H}_k \mathbf{P}_{k-1} \mathbf{H}_k^T + \mathbf{H}_k \mathcal{Q}_{k-1} \mathbf{H}_k^T + \mathcal{R}_k$$

$$4: \mathbf{M}_k = \left(\mathbf{H}_k^T \tilde{\mathcal{R}}_k^{-1} \mathbf{H}_k \right)^{-1} \mathbf{H}_k^T \tilde{\mathcal{R}}_k^{-1}$$

$$5: \hat{\omega}_{k-1} = \mathbf{M}_k (\mathbf{y}_k - h(\hat{\mathbf{R}}_{k|k-1}))$$

▷ **Prior state estimation:**

$$6: \hat{\mathbf{R}}_k^* = \hat{\mathbf{R}}_{k|k-1} \exp_m(\hat{\omega}_{k-1})$$

▷ **Correction:**

$$7: \mathbf{H}_k^* = \left. \frac{\partial h(\hat{\mathbf{R}}_k^* \exp_m(\xi))}{\partial \xi} \right|_{\xi=0}$$

$$8: \mathcal{R}_k^* = (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k) \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T$$

$$\mathcal{S}_k^* = \mathbf{M}_k \mathcal{R}_k (\mathbf{I}_m - \mathbf{H}_k^* \mathbf{M}_k)^T$$

$$9: \mathbf{K}_k = -\mathcal{S}_k^* (\mathcal{R}_k^*)^\dagger$$

$$10: \hat{\mathbf{R}}_k = \hat{\mathbf{R}}_k^* \exp_m(\mathbf{K}_k (\mathbf{y}_k - h(\hat{\mathbf{R}}_k^*)))$$

$$11: \mathbf{P}_k = \mathbf{K}_k \mathcal{S}_k^{*T} + \mathbf{M}_k \mathcal{R}_k \mathbf{M}_k^T$$

12: **return** $\hat{\mathbf{R}}_k$, \mathbf{P}_k

- 1 Introduction
- 2 UMV-SO(3)
- 3 Simulations setup and main results**
- 4 Conclusion

Simulation Setup

Algorithm	Acc	Mag	Gyro	Current consumptions
UMV-SO(3)	✓	✓		Microampere range
TRIAD	✓	✓		Microampere range
IEKF	✓	✓	✓	Milliampere range

- Monte Carlo simulations with 100 runs for each scenario.
- We use the following true angular velocities.

True angular velocity (<i>rad/s</i>)	
ω_x	$2.0 \cos(0.2\pi k\Delta T)$
ω_y	$1.5 \cos(0.6\pi k\Delta T)$
ω_z	$1.0 \cos(1.0\pi k\Delta T)$

- The accelerometer and magnetometer noises were set to be zero-mean white noise signals with standard deviations of $\sigma_a = 0.01 \text{ m/s}^2$, and $\sigma_m = 0.005 \text{ Gauss}$.

Compare with IEKF and TRIAD results

RMSE (in degrees) for both UMV-SO(3) and TRIAD

TRIAD RMSE (degrees)	UMV-SO(3) RMSE (degrees)
0.73	0.47

- UMV-SO(3) shows a **39%** improvement in RMSE compared to TRIAD.

RMSE (in degrees) for both UMV-SO(3) and IEKF for various gyroscope noise level

σ_ω (rad/sec)	IEKF RMSE (degrees)	UMV-SO(3) RMSE (degrees)
0.01	0.35	0.47
0.05	0.60	
0.10	0.71	

- UMV-SO(3) has comparable accuracy with IEKF.
- IEKF remains sensitive to the gyroscope noise.
- IEKF consumes more power than UMV-SO(3).
- IEKF needs to know the gyroscope noise covariance matrix and bias.

- 4 Conclusion**

Conclusion

Results Summary:

- UMV-SO(3) provides an effective solution for attitude estimation.
- Monte Carlo simulations showed that our UMV-SO(3) algorithm outperformed TRIAD.
- UMV-SO(3) has comparable accuracy with IEKF.

Contributions Summary:

- Design algorithm for state estimation on SO(3) with unknown input without direct feedthrough to the output.
- The design of a novel algorithm for gyro-free attitude estimation.
